The Sapphire Group Joins Forces with DuPont's Haskell Laboratory

The Sapphire Group is pleased to announce that it has formed a joint business alliance with DuPont's Haskell Laboratory. Founded in 1935, DuPont's Haskell Laboratory is one of the world's premiere laboratories for toxicology and industrial medicine. The strength of this relationship allows The Sapphire Group to offer its clients the performance benefits of the full range of toxicological studies, both mammalian and ecological.

One of the major attributes of the scientists at DuPont's Haskell Laboratory is their ability to successfully conduct mode of action and metabolism studies. These types of studies are vital to the demonstration of a product's chemical safety in the workplace and the marketplace. "The quality of DuPont's Haskell Laboratory is unsurpassed," says Dr. Robert Tardiff, president of The Sapphire Group.

The advantage for clients in extending these types of services is it offers an enormous difference in the robustness of a risk assessment. The scientists at The Sapphire Group are experts in their ability to interpret the findings of this type of work, merge it with their epidemiological studies and the works of other investigators to provide defensible and insightful conclusions and business recommendations.
